H(NULL): CPB HAS NO RELATION WITH ICU_STAY LONGER THE CPB_TIME LONGER IS ICU_STAY

H1:

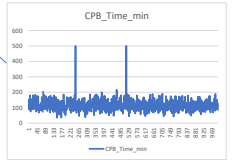

Regression Results and Conclusion

The regression analysis showed that patients with longer CPB times tended to have longer ICU stays. The slope was 0.01864, and the R-squared value was 0.1316, meaning that CPB time explained about 13.16% of the differences in ICU stay. The p-value was extremely small (3.7202×10^{-32}), which is below the 0.05 significance level.

Based on these results, the null hypothesis was rejected, and the findings supported the alternative hypothesis. This suggests that longer CPB time is significantly associated with longer ICU stay in this dataset. However, this does not prove that longer CPB time directly causes patients to stay longer in the ICU.
